# GENOMICS PROVES THAT S.A. HAS SUPERIOR DAIRY SWISS SIRE

The South African Dairy Swiss (Brown Swiss) bull "Hugh" is the 1<sup>st</sup> South African Dairy Swiss bull to receive an Inter-genomic proof. This is due to TAURUS EVOLUTION gaining access to Inter-genomics, the international genomic database for Brown Swiss through its French mother company EVOLUTION and BGS.

The bull "Hugh" a Huray son has an extremely high proof for milk & components with a well-balanced type and good functional traits.

The bull has a French ISU index of 162 and INEL of 53, which rates him amongst the best in France. He is +1561kg for milk with +46kg & +47kg for protein and butterfat respectively, this relates to +0.01 & -0.16 for protein & butterfat percentages. Add to this, him having BB kappa casein and you have a bull perfect for cheese producers. He has a type index of +0,6 with Udder Composite of +0,3 and Feet & leg composite of 0,8. This together with a Reproduction index of 0,5 and longevity index of 1,0 makes this a truly world class bull.

This is undoubtedly at present the best Dairy Swiss bull bred in South Africa and his excellent genomic performance results prove that South Africa have an outstanding, albeit small Dairy Swiss population, that is comparable to other populations around the world.

Taurus Evolution is very proud to be the distributor of this exceptional S.A. Dairy Swiss bull and have made his semen available to the South African dairy industry for use in Dairy Swiss and commercial crossbreeding herds. According to Taurus Evolution, he's use will not be limited to South Africa and his 1<sup>st</sup> doses are being exported to several countries already.
